Study: Wildfire Smoke Exposure Has Increased 27-Fold In US

October 9, 2023

The average person in the U.S. has been exposed to more wildfire smoke this year than any other year since 2016. But this problem has been increasing with global warming, with particulate matter exposure from wildfire smoke now 27 times where it was a decade ago.

Canadian wildfire smoke invades Florida choking skies with smoke, unhealthy air quality

Canadian wildfire smoke ended up in Florida due to the combination of a low-pressure system over Florida from this past weekend and a high-pressure system over the eastern U.S., causing the winds around those systems to carry it as far south as Miami.

Fire is an inevitable part of nature, but megafires are not.

Wildfire climate connection

Share:

Climate change, including increased heat, extended drought, and a thirsty atmosphere, has been a key driver in increasing the risk and extent of wildfires in the western United States during the last two decades. Wildfires require the alignment of a number of factors, including temperature, humidity, and the lack of moisture in fuels, such as trees, shrubs, grasses, and forest debris. All these factors have strong direct or indirect ties to climate variability and climate change.

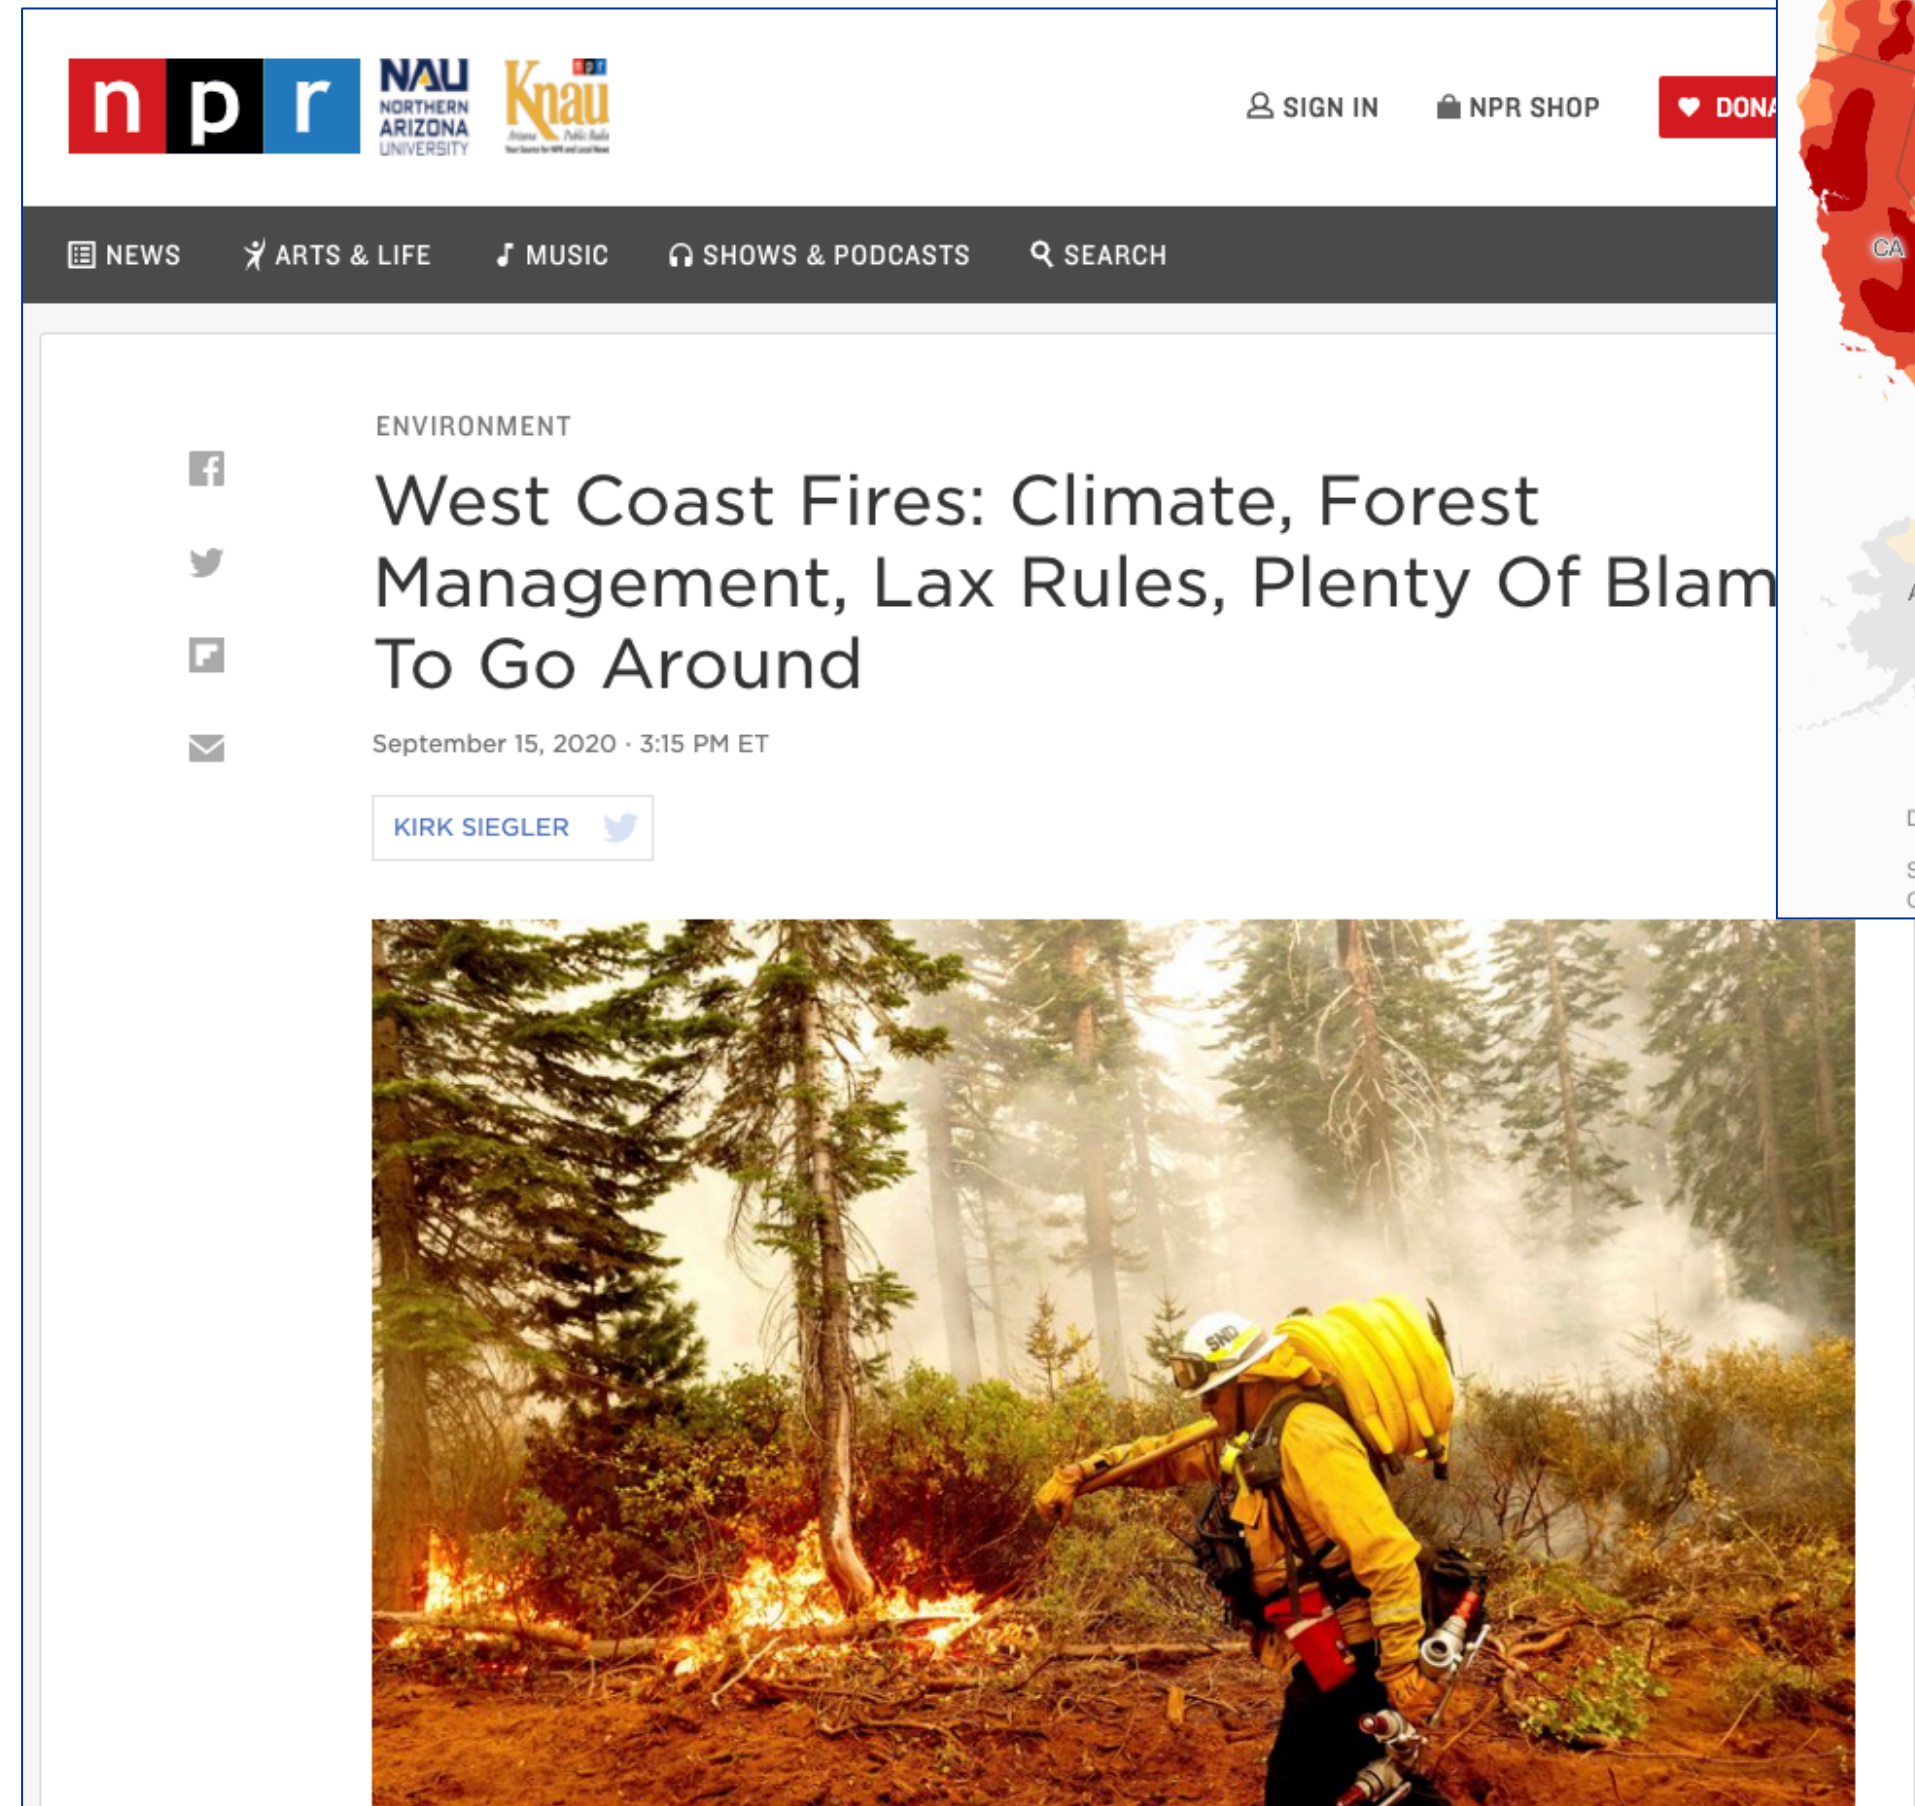

A 2016 study found climate change enhanced the drying of organic matter and [doubled the number of large fires between 1984 and 2015](#) in the western United States. A 2021 study [supported by NOAA](#) concluded that climate change has been the [main driver of the increase in fire weather](#) in the western United States.

Drought and persistent heat set the stage for extraordinary wildfire seasons from 2020 to 2022 across many western states, with all three years far surpassing the average of 1.2 million acres burned since 2016. Extreme fire behavior during this period shocked many wildfire managers, as

There are many reasons for the megafires we are having today.

A century of fire suppression!

*Too few good fires (low intensity)
and
too many bad fires (high intensity.)*

*Fire
deficit!*

Wildland Fire Deficit

- Apocalyptic wildfires have become the norm. The 2021 Dixie fire was the largest single-source wildfire in CA history.
- A policy of wildfire suppression has resulted in fuel accumulation, increasing the risk of severe wildfires during fire season.
- Climate change (megadroughts, heatwaves) and invasive species exacerbate the problem

The solution:

Proactive wildfire risk mitigation through **prescribed burns**.

2022

US launches a new ten-year strategy to proactively confront the wildfire crisis by ramping up prescribed burns by 4X!

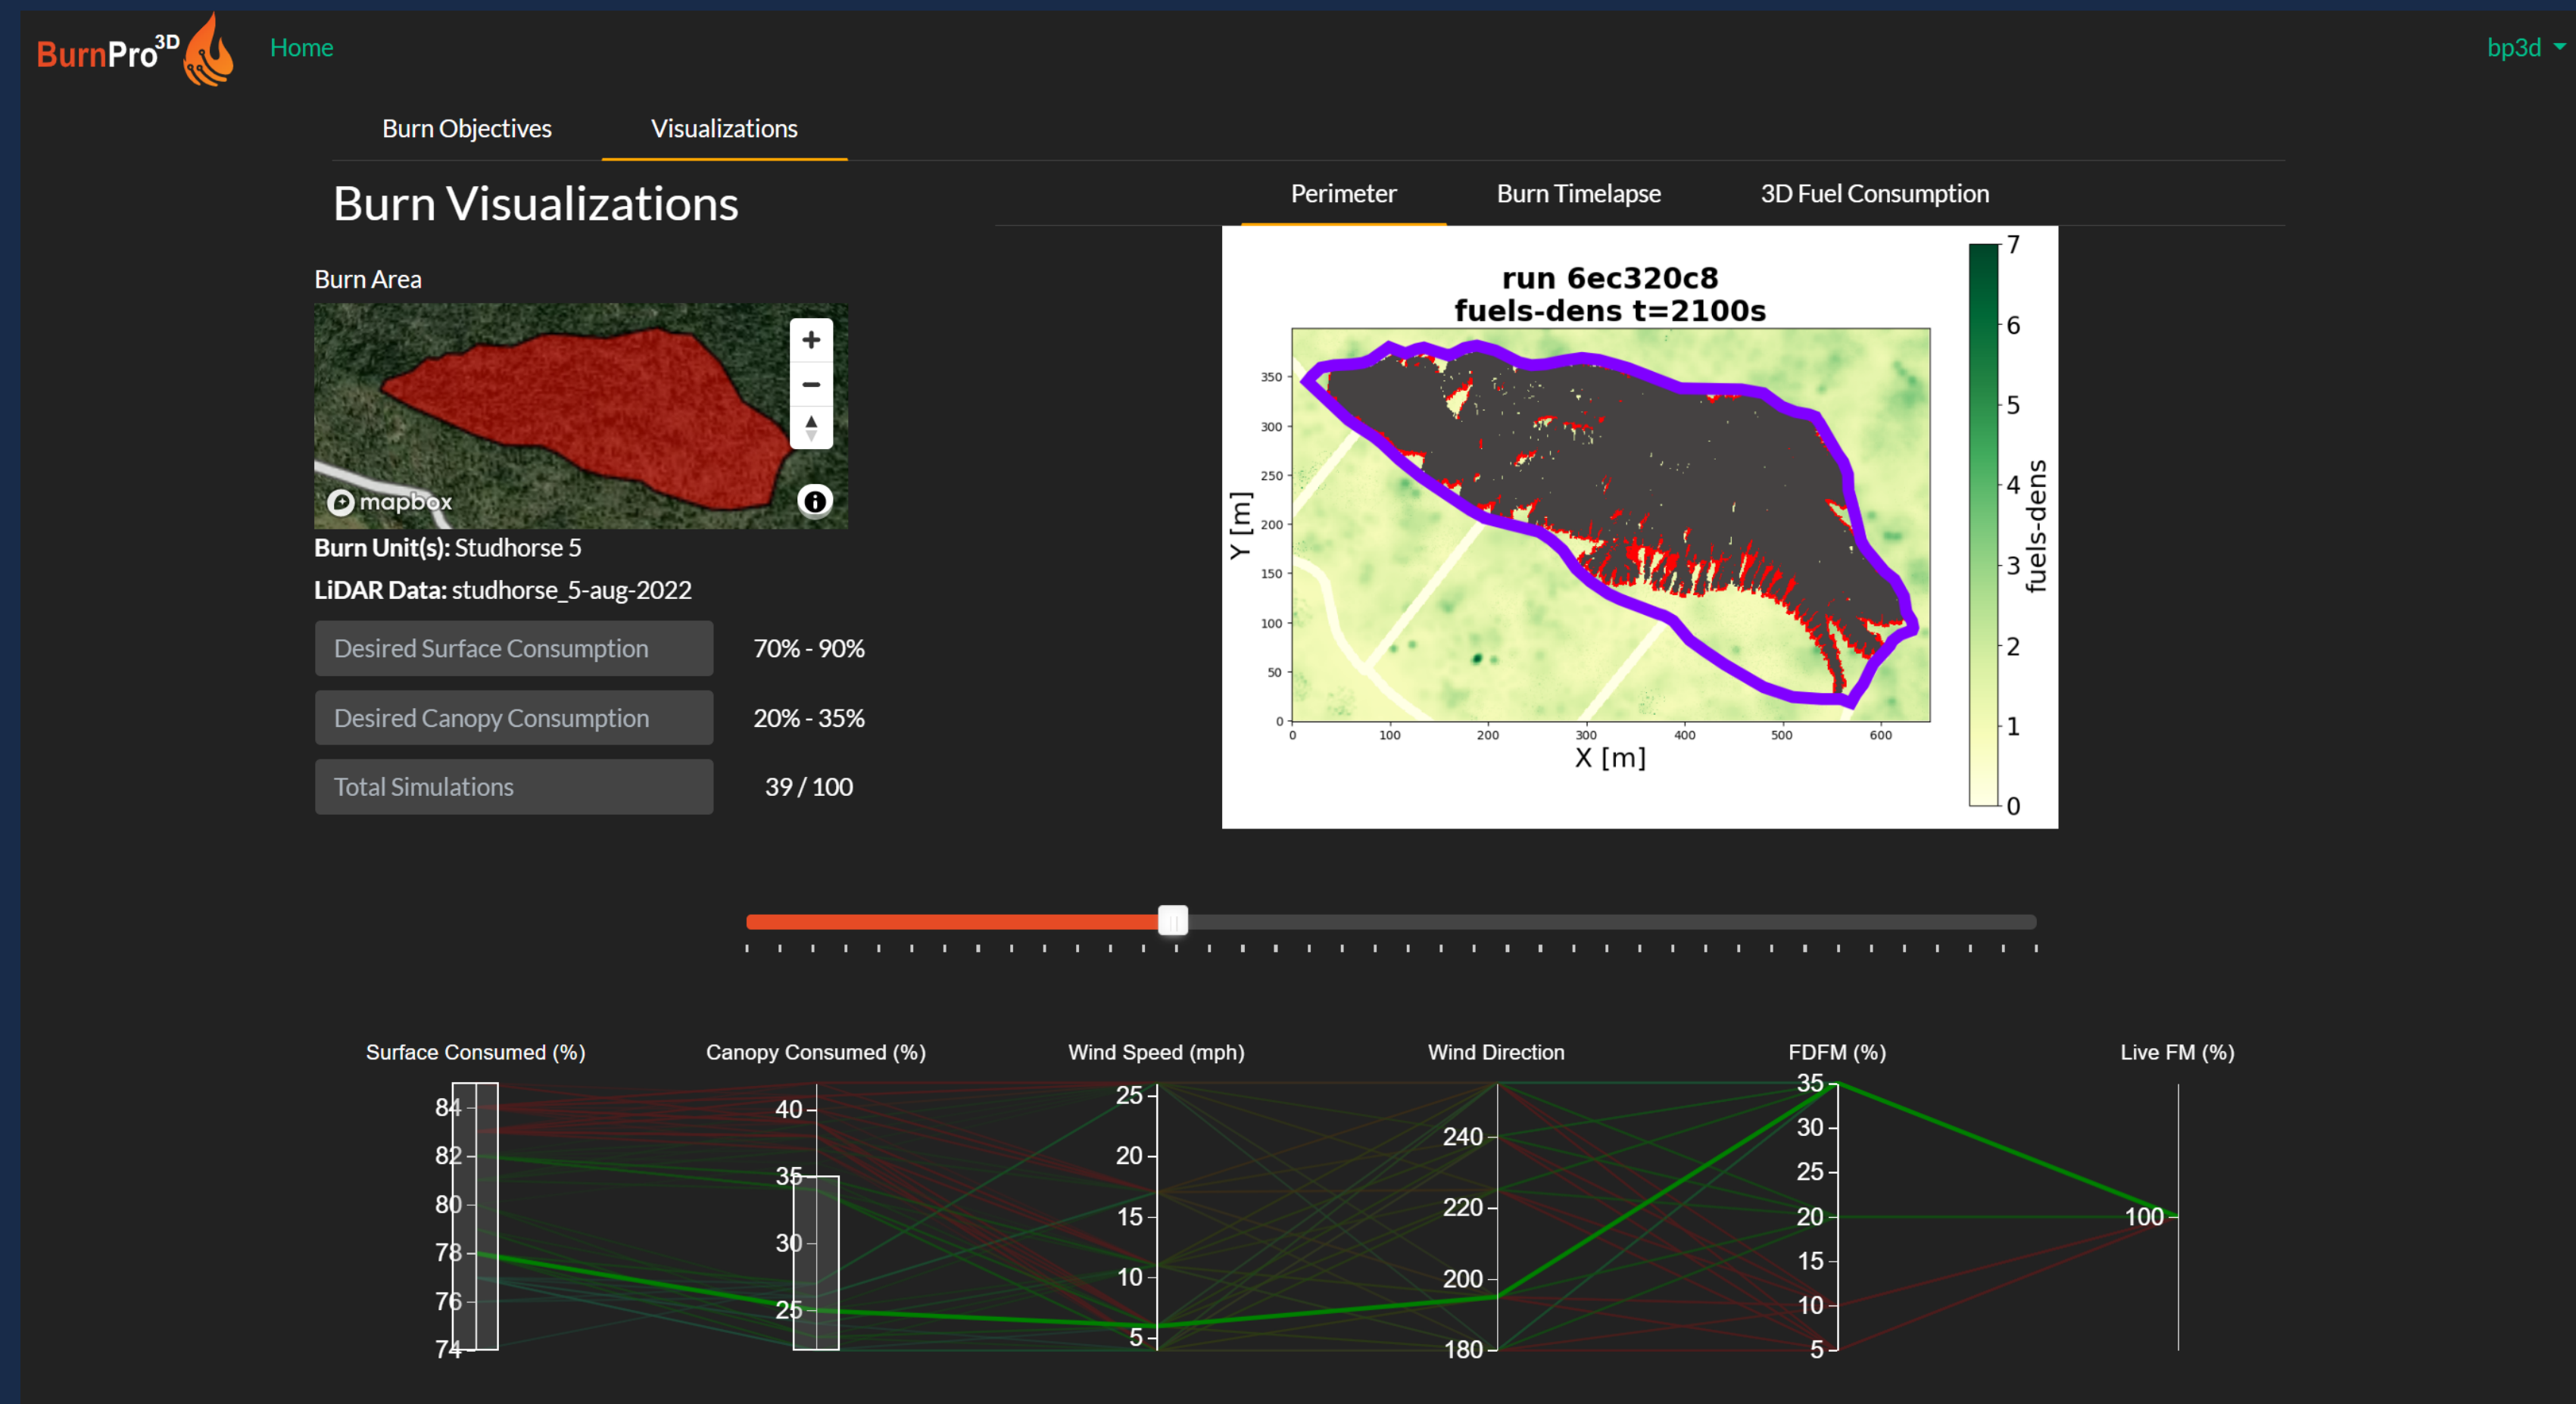

The screenshot shows the USDA Forest Service website. At the top left is the USDA logo and the text 'Forest Service U.S. DEPARTMENT OF AGRICULTURE'. To the right is a search bar with the text 'Enter Keyword(s)' and a green 'GO' button. Below the header is a navigation menu with links: 'Visit Us', 'Managing the Land' (which is underlined), 'Learn', 'Science and Technology', 'Working with Us', 'About the Agency', and 'Inside the FS'. Below the navigation menu is a breadcrumb trail: 'Home > Managing the Land > Confronting the Wildfire Crisis'. The main content area is divided into two columns. The left column is a sidebar with a 'Wildfire Crisis' section containing links for 'Initial Landscape Investments', 'Press Kit', and 'Support From Our Partners'. Below this is a 'Managing the Land' section with links for 'Forests and Grasslands', 'Natural Resources', 'Recreation Management', 'Fire Management', 'Sustainability and Climate', 'Invasive Species', 'Private Land', 'Urban Forests', and 'International Cooperation'. The right column features the main article title 'Confronting the Wildfire Crisis'. The article text begins with 'The Forest Service has launched a robust, 10-year strategy to squarely address this wildfire crisis in the places where it poses the most immediate threats to communities. The strategy, called "Confronting the Wildfire Crisis: A Strategy for Protecting Communities and Improving Resilience in America's Forests," combines a historic investment of congressional funding with years of scientific research and planning into a national effort that will dramatically increase the scale of forest health treatments over the next decade.' Below this is another paragraph: 'Though the Forest Service has been working to manage the health of millions of acres of national forests across the American West for decades, the scale and methods of work on the ground have not matched the need. With the support of our partners, states, Tribes and local communities, the Forest Service is collaboratively implementing this new strategy across jurisdictions and landownerships to protect communities, critical infrastructure, watersheds, habitats, and recreational areas.' To the right of the text is a large image showing a destroyed building with an American flag amidst a forest fire. Above the image is the USDA Forest Service logo and the text 'FS-1187a | January 2022'. Below the image is the title 'CONFRONTING THE WILDFIRE CRISIS' and the subtitle 'A Strategy for Protecting Communities and Improving Resilience in America's Forests'.

BurnPro^{3D}

- BurnPro3D is a decision-making tool to plan safe and effective prescribed burns
- It uses a coupled fire/ atmosphere model to capture the interaction between user-defined ignition patterns and environmental (weather, fuel) conditions.
- Powered by the Wifire Data and Models Commons and led by Dr. Ilkay Altintas

Four Pillars of BurnPro3D

FastFuels

FastFuels is “a 3D fuels super-highway” that accelerates the use of 3D fire models.

FastFuels is “a 3D fuels super-highway” that accelerates the use of 3D fire models.

TrueTrees represents an “on-ramp” to this superhighway that integrates ALS observations into 3D fuels.

Tree Parameters (Dendrometrics) in FastFuels and TrueTrees

Tree Parameter	FIA Symbol	FastFuels	TrueTrees
Position [m]	X, Y	Modeled from forestry data	Measured by Lidar
Height [m]	HT		
Crown radius [m]	CR		
Diameter [m]	DIA		Modeled from Lidar and forestry data
Species code	SPCD		
Crown base height	CBH	N/A	N/A
Statuscode	STATUSCD		

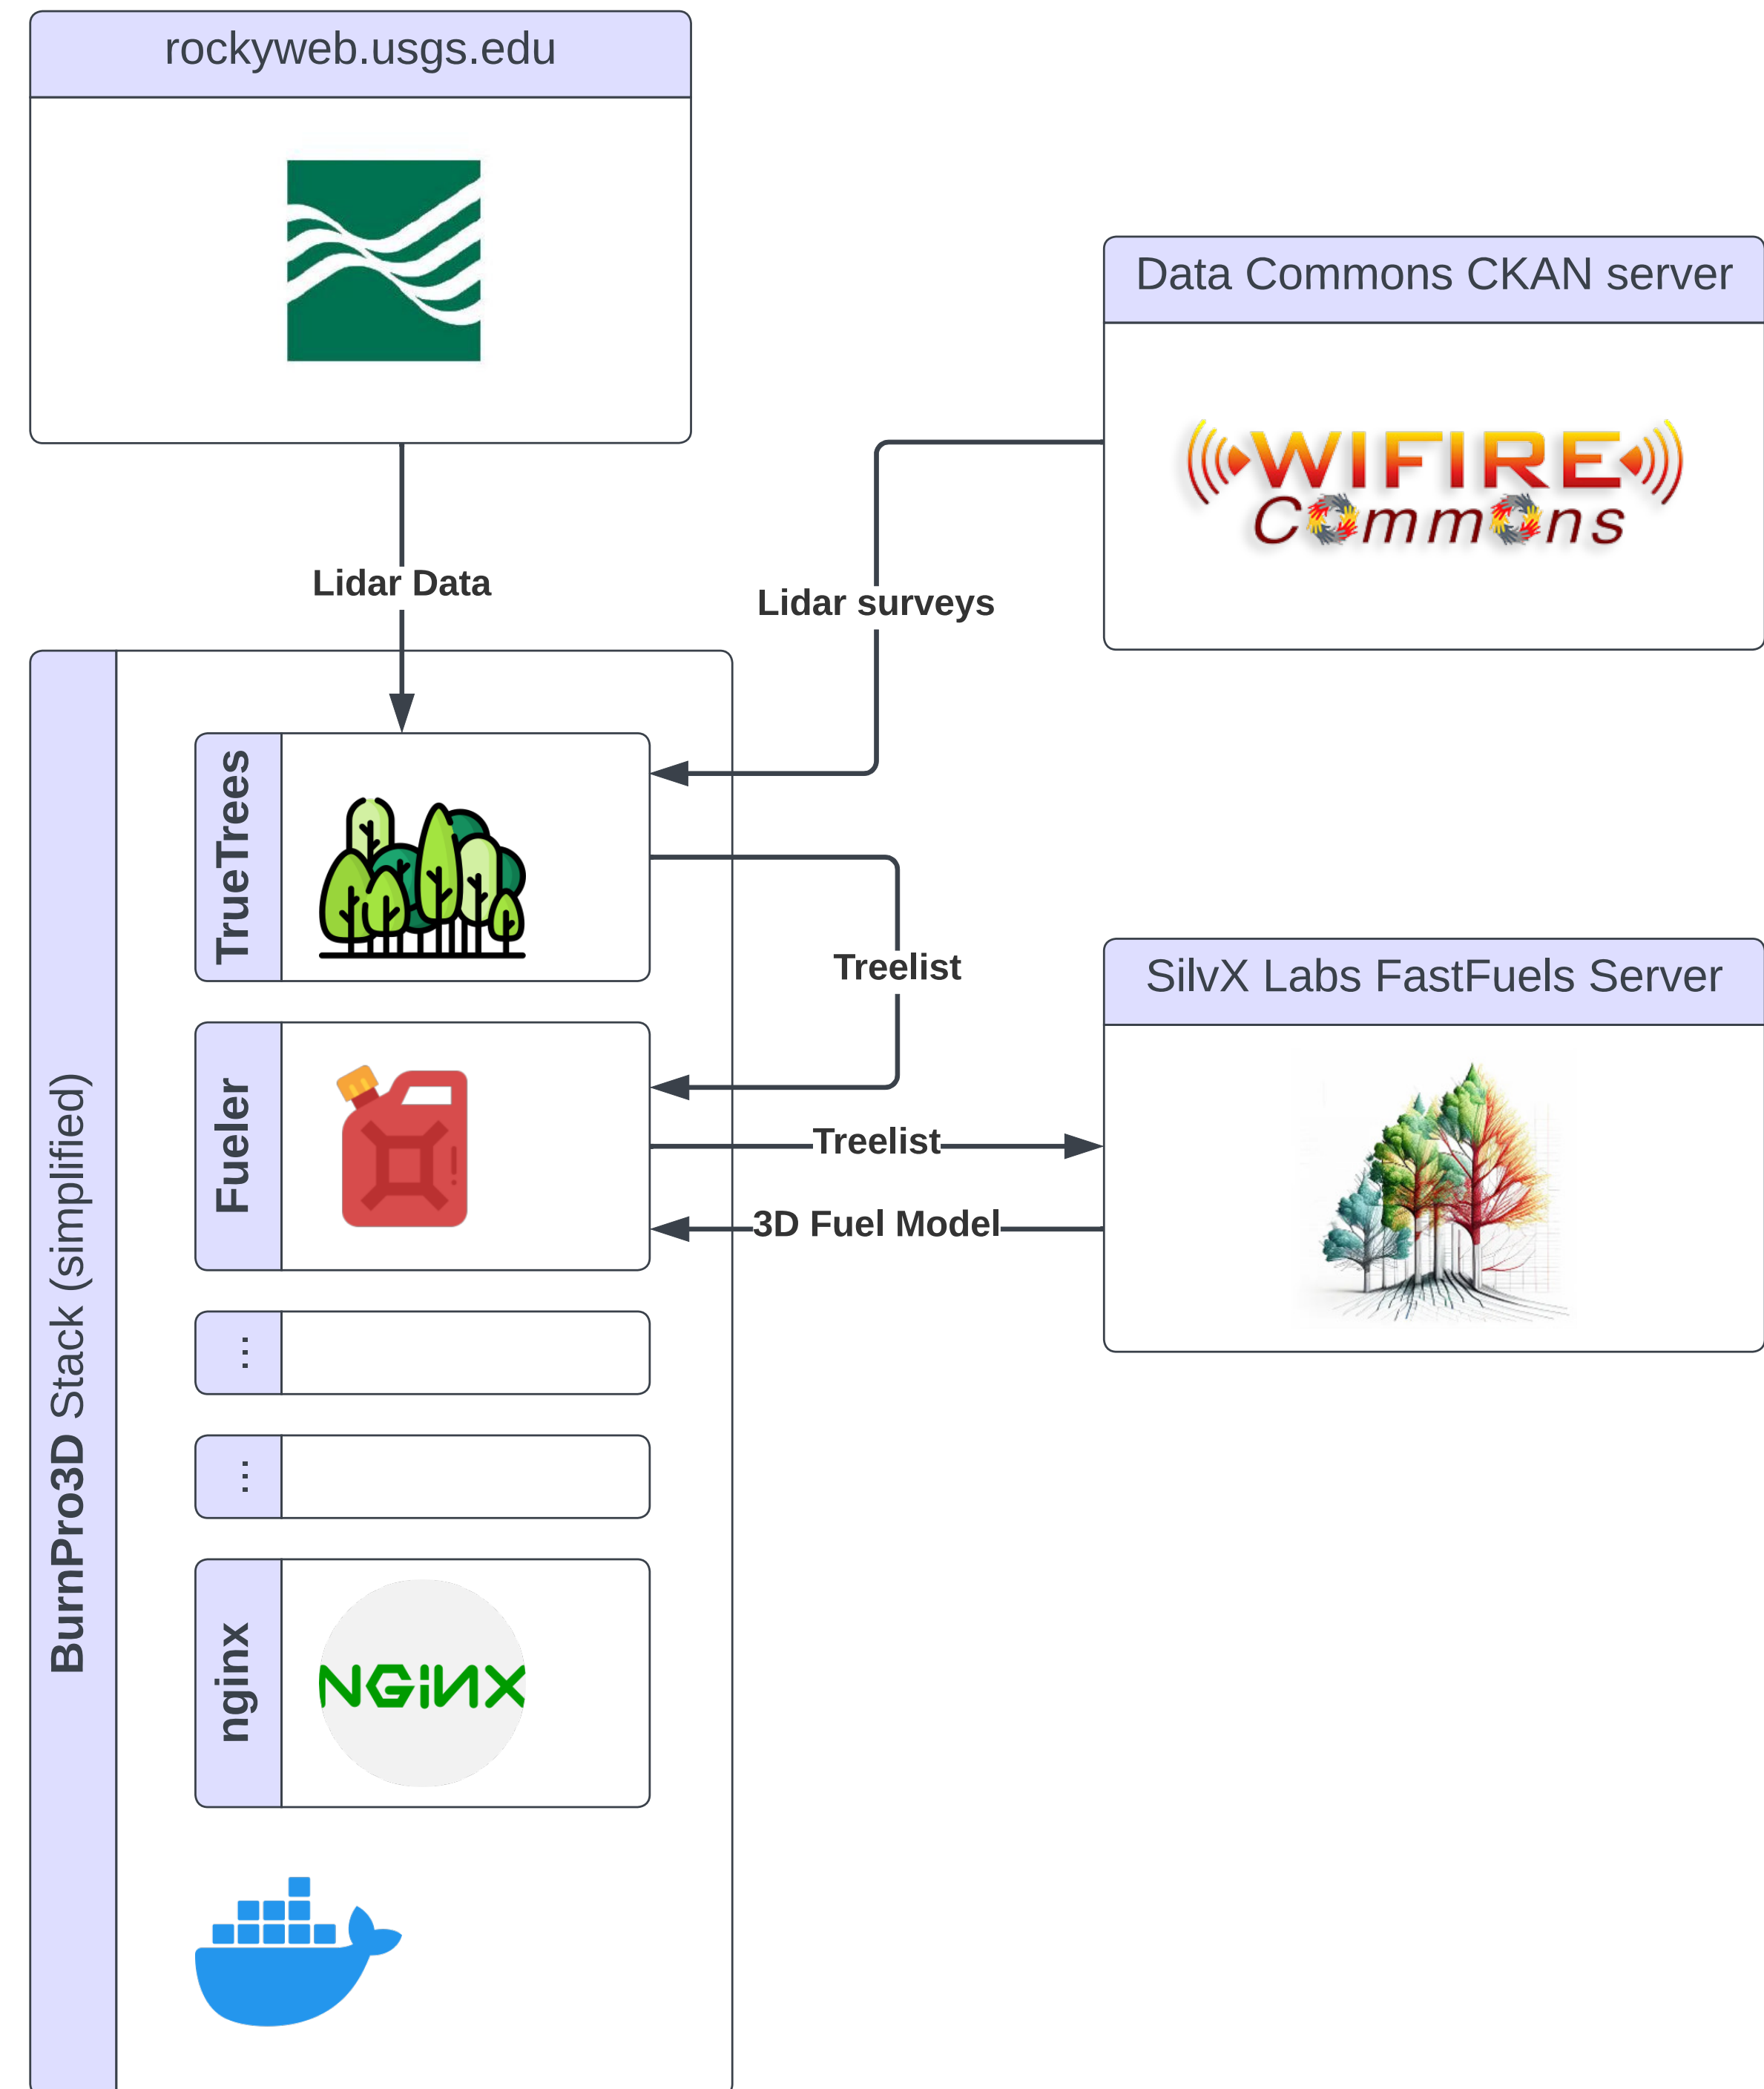

TrueTrees is a scalable, automatic workflow that carries out two main tasks:

1. Raw Lidar point cloud data query, retrieval and **treelist extraction**.
2. **Modeling** of tree parameters that can not directly be determined by Lidar.

TrueTrees interacts with multiple external **data sources** and **services**:

- USGS 3DEP Lidar data repository (Rockyweb)
- WIFIRE Commons Data catalog (Lidar metadata)
- FastFuels Server (SilvX Labs)

TrueTrees workflow is integrated in **BurnPro3D software stack**.

Gaussian NB Classifier for Species Imputation

- Probability that tree of height X belongs to species k :

$$p(C_k | z = X) = \frac{p(C_k) p(z = X | C_k)}{p(z = X)}$$

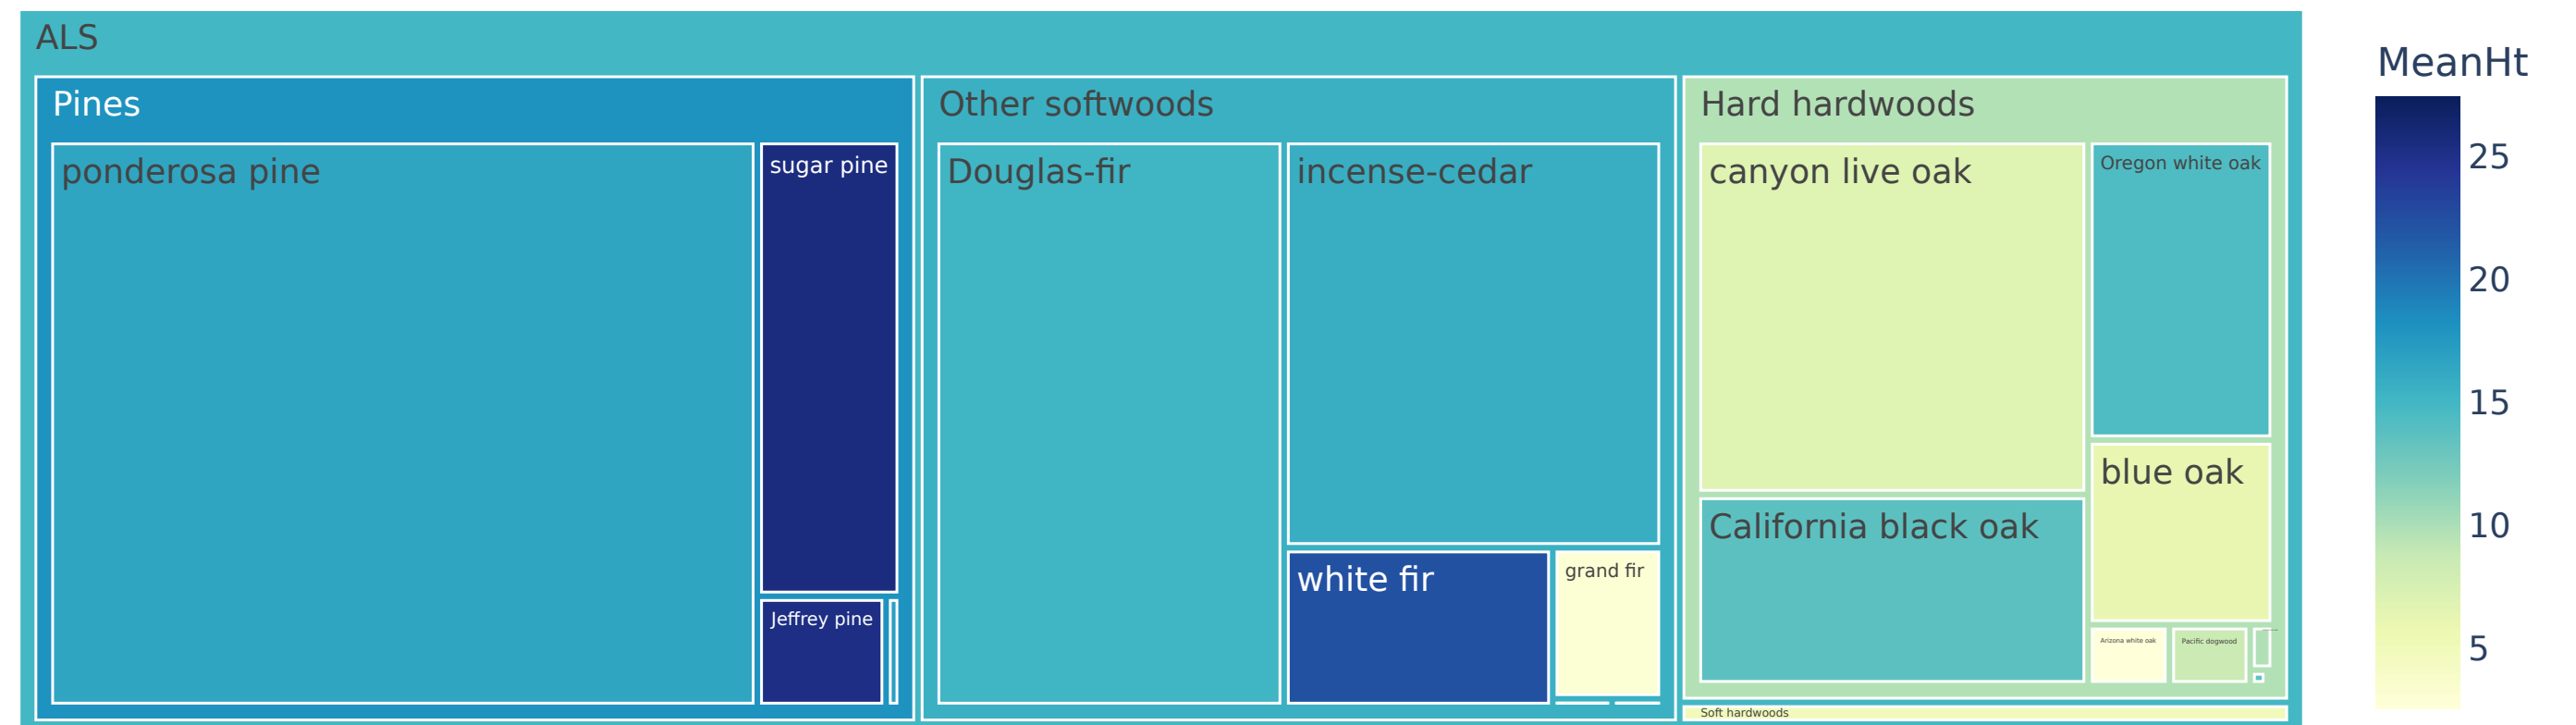

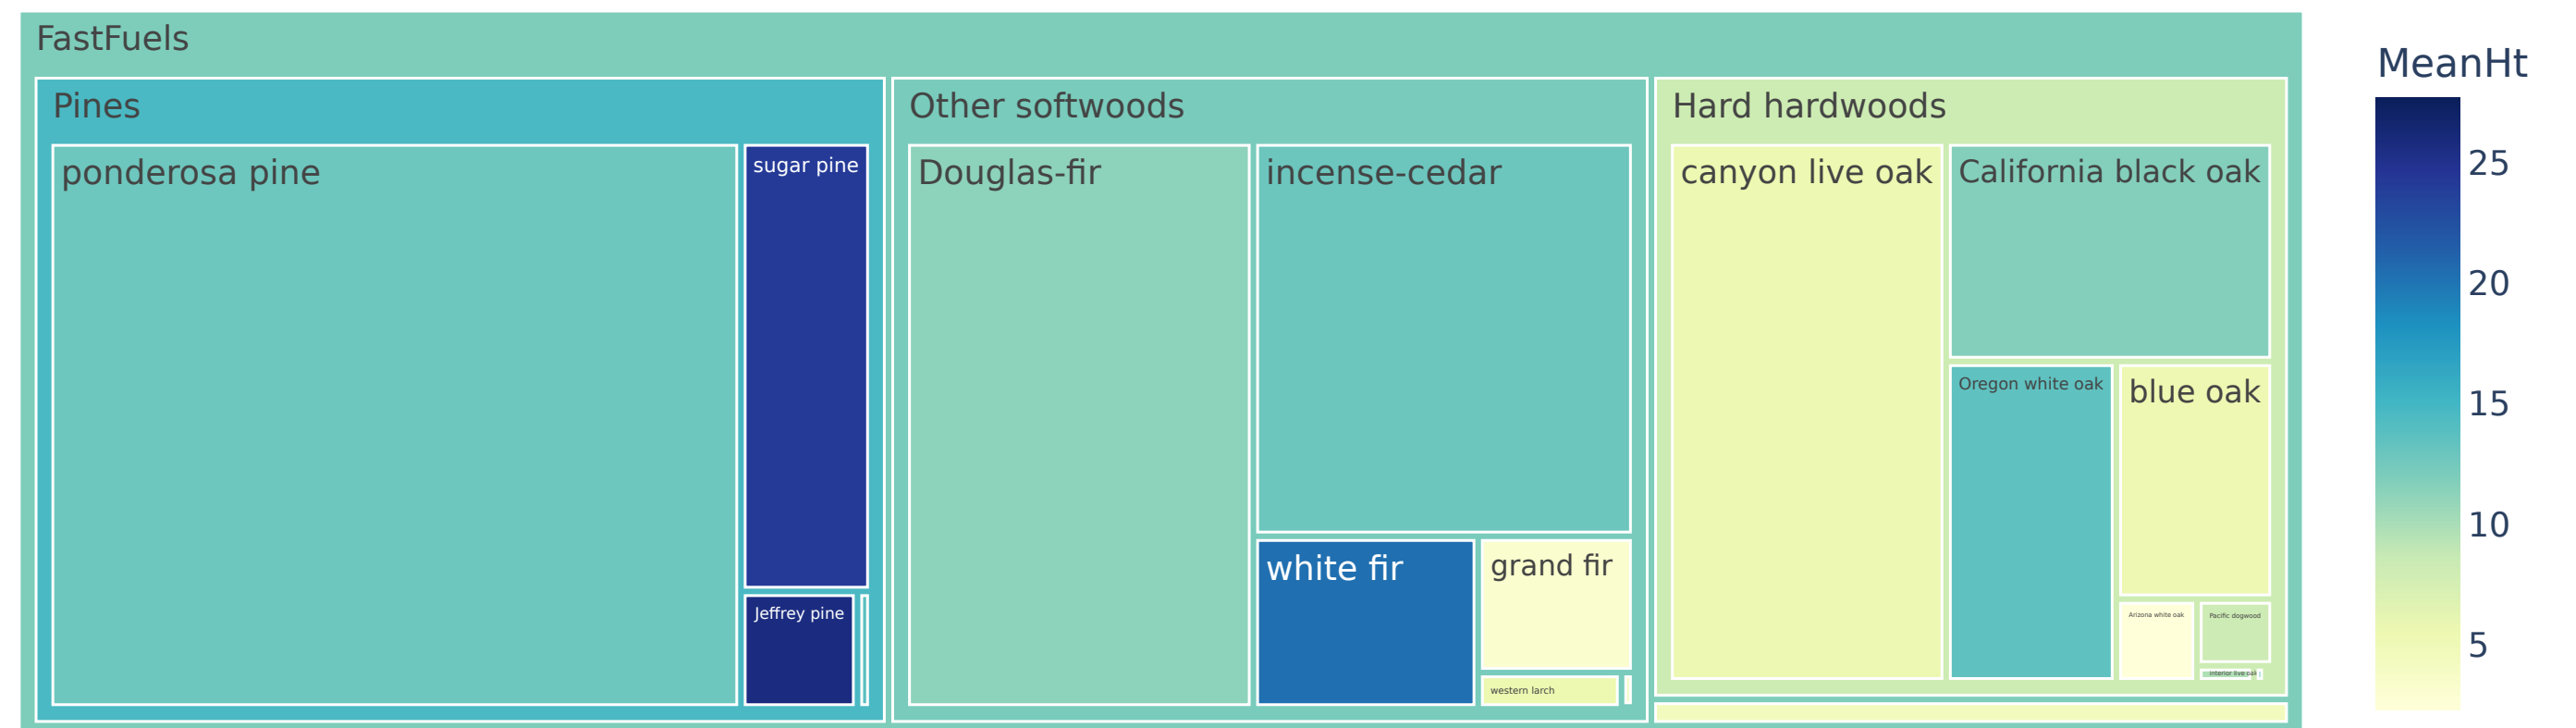

Gaussian NB Classifier for Species Imputation

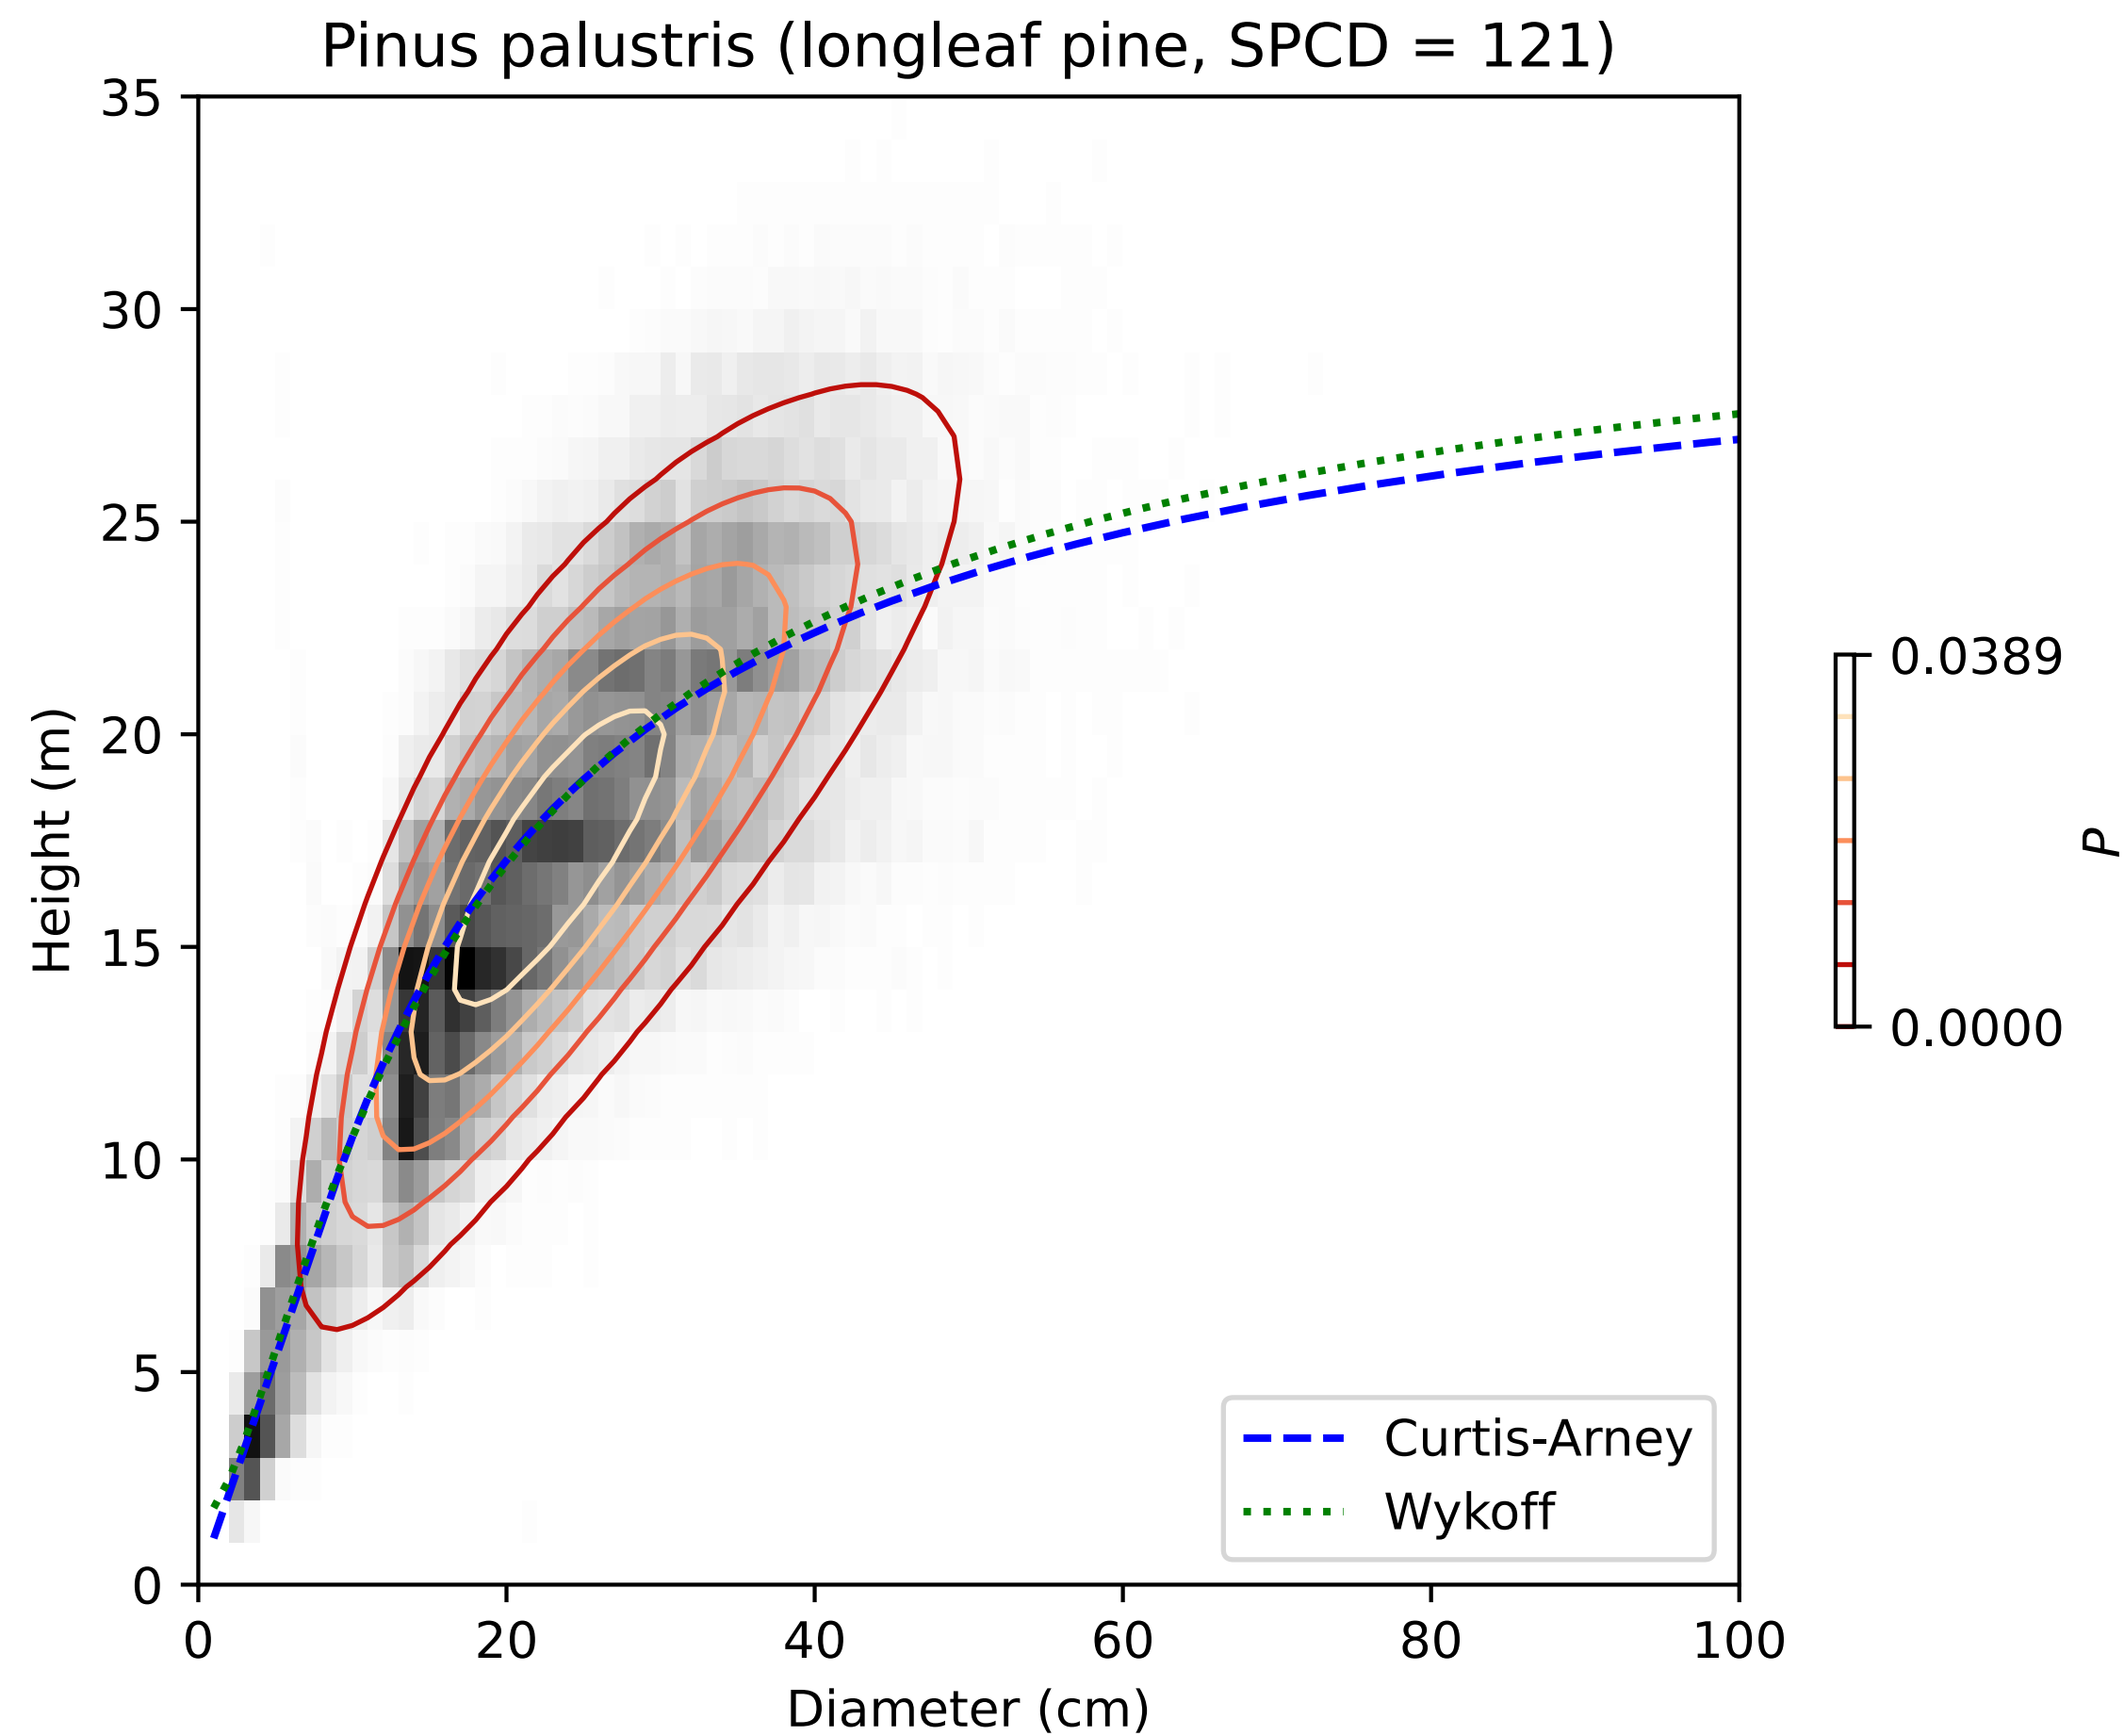

- Probability that tree of height X belongs to species k :

$$p(C_k | z = X) = \frac{p(C_k) p(z = X | C_k)}{p(z = X)}$$

- Correction factor is applied to priors to reproduce species composition in forest inventory data

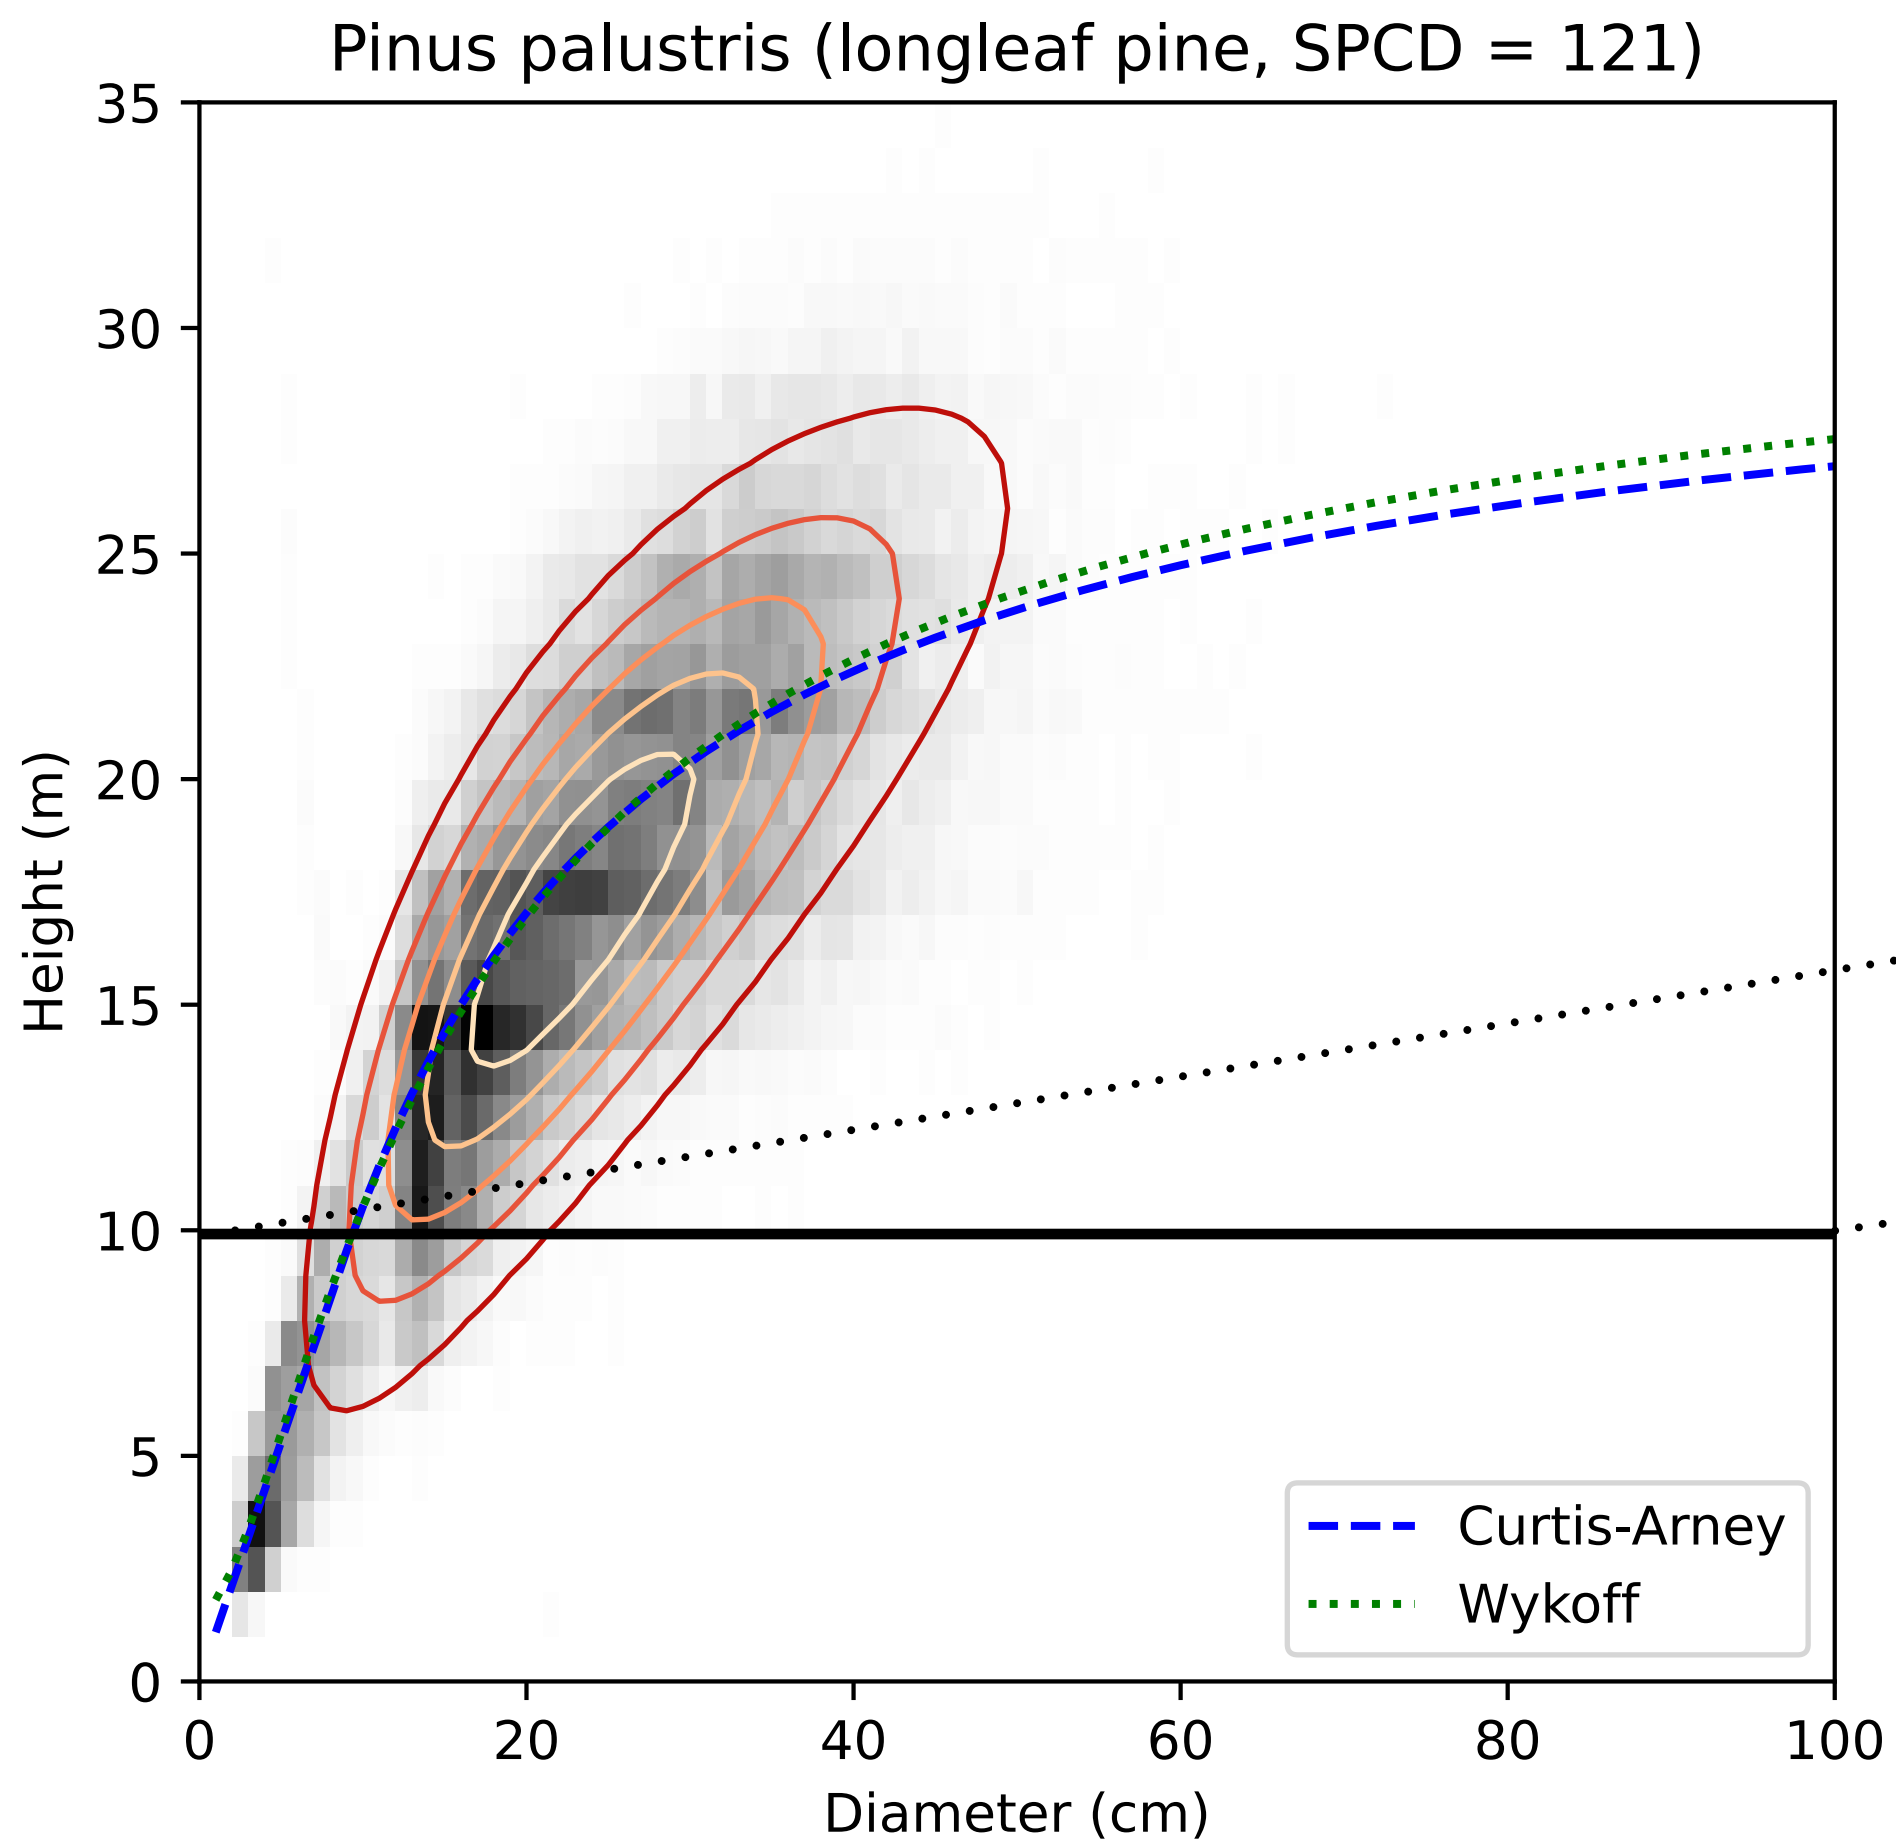

Tree Diameter Modeling

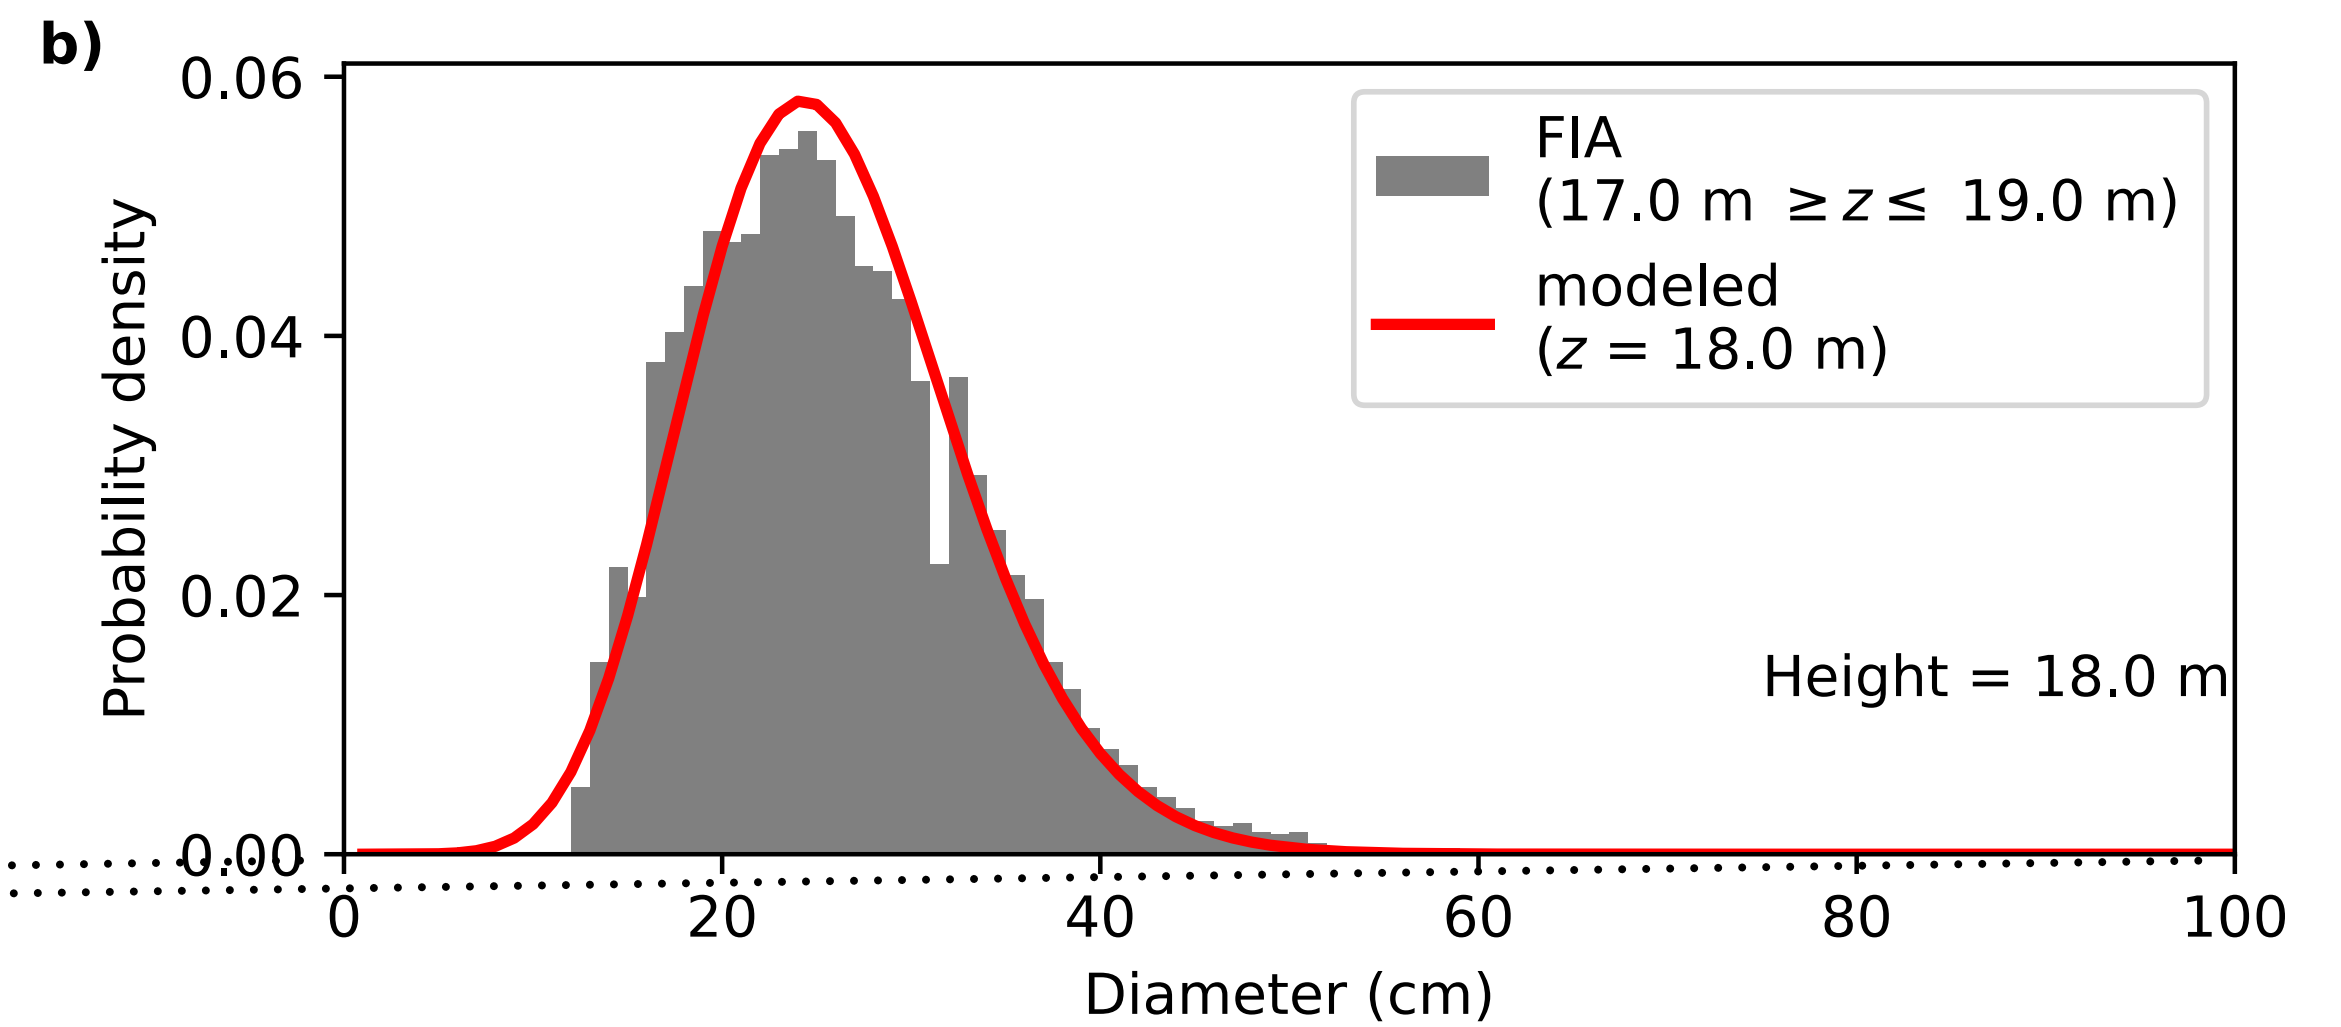

- 2D Gaussian model of diameter-height -distribution fitted to forest inventory analysis database for each species

Tree Diameter Modeling

- 2D Gaussian model of diameter-height -distribution fitted to forest inventory analysis database for each species
- Sample is drawn from 1D Gaussian for given tree-height and species

Tree Diameter Modeling

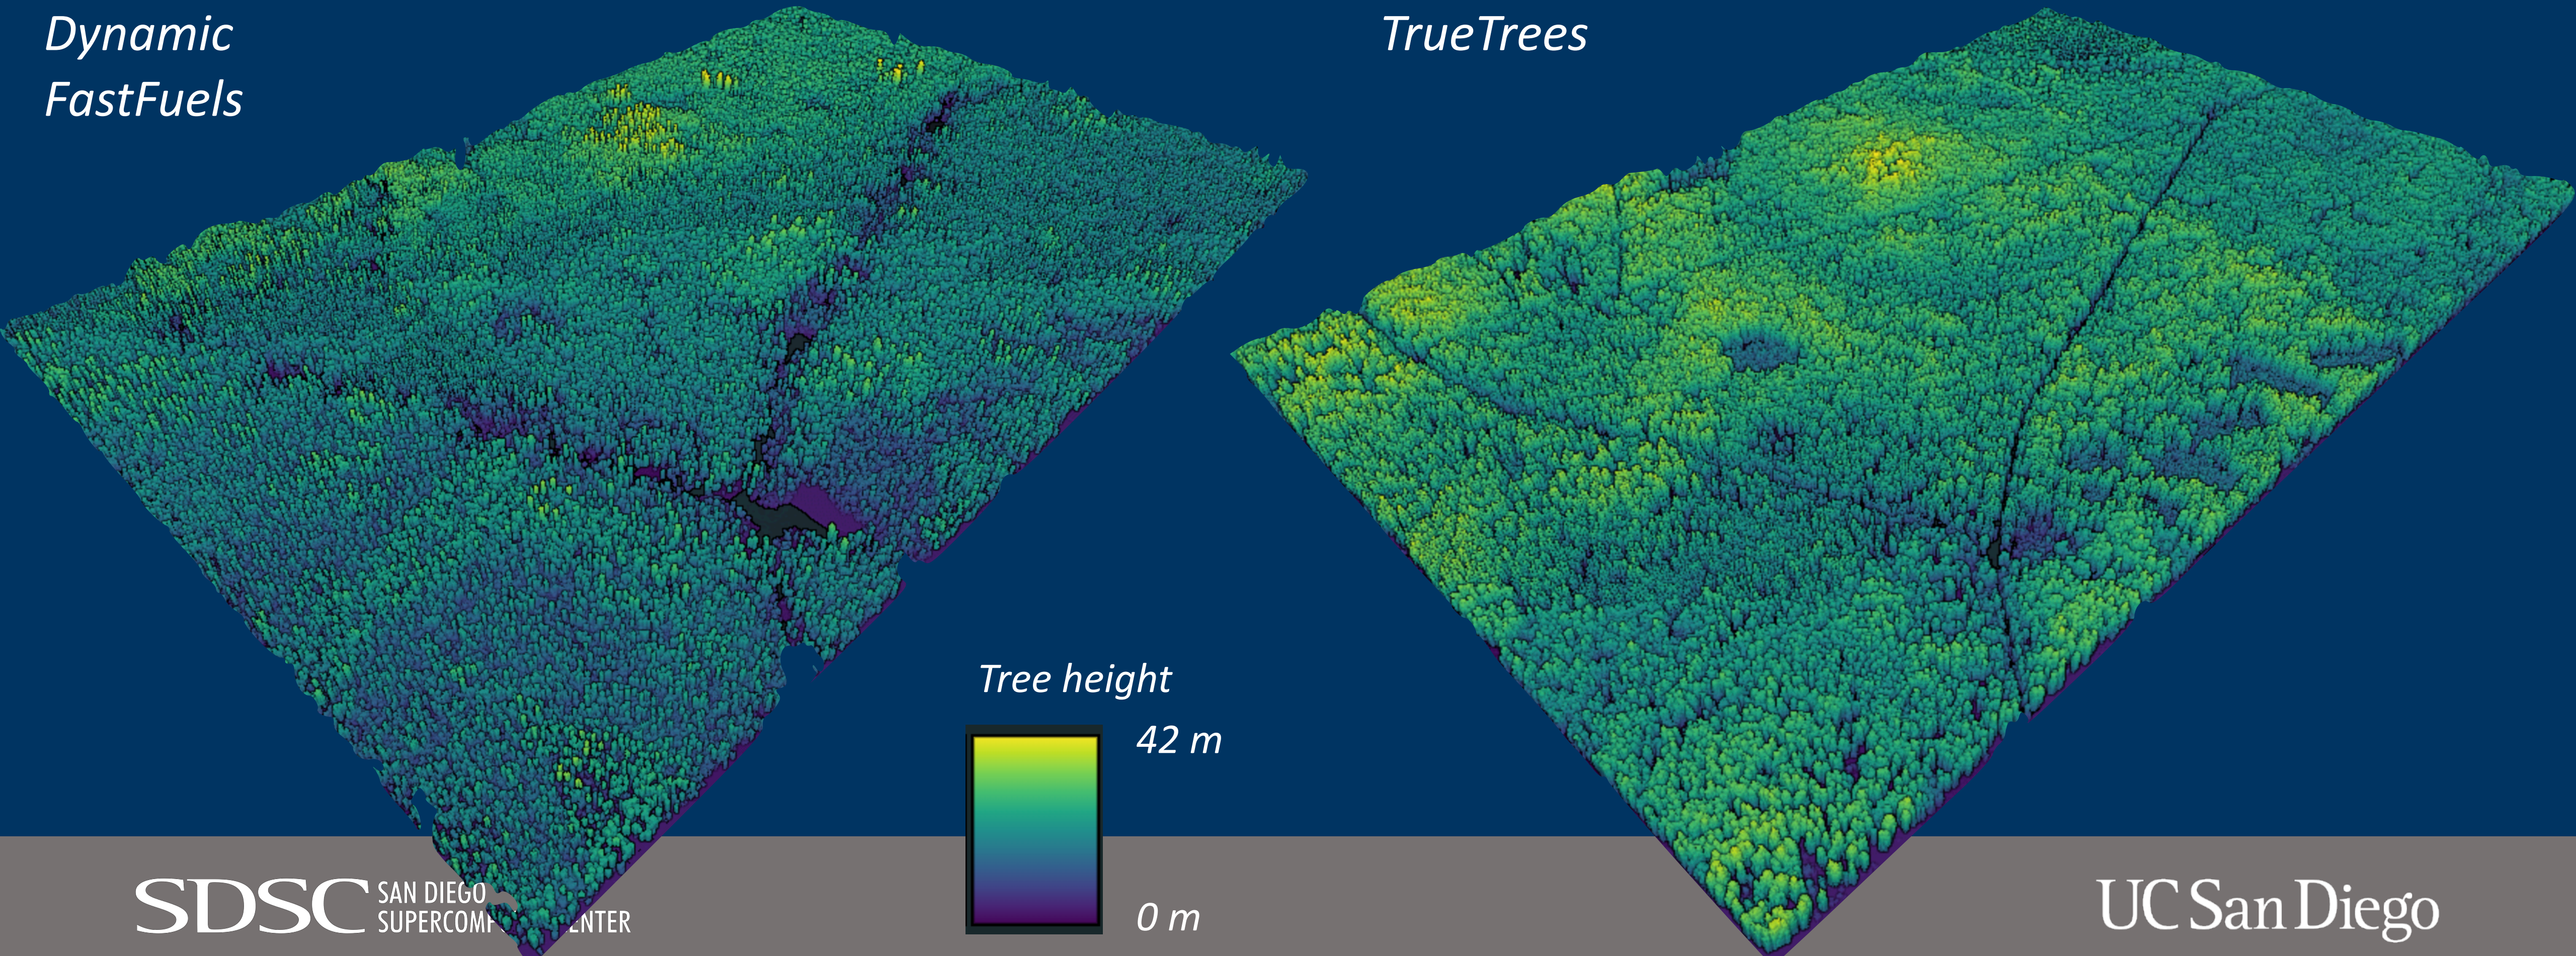

- 2D Gaussian model of diameter-height -distribution fitted to forest inventory analysis database for each species

FastFuels*

TrueTrees

Summary

- Prescribed burns are a proven way to mitigate wildfires in the face of heatwaves, megadroughts and fuel accumulation.
- **BurnPro3D** is a prescribed burn planning tool that combines advanced fire simulations and the 3D fuel models **FastFuels** to identify safe burn conditions.
- **TrueTrees** is an on-ramp to FastFuels that replaces randomly generated tree parameters in FastFuels with Lidar observations.
- A scalable, automatic workflow was developed to automatically identify available Lidar surveys, extract tree parameters from raw point cloud data and models and models missing parameters.
- The workflow is integrated in the BurnPro3D application stack.
